

NIKONOS-II

(Work No. 9F2B)

REPAIR MANUAL

NIPPON KOGAKU K.K.

Tokyo, Japan

C O N T E N T S

	Page
Illustrations	1 - 9
List of O-ring	10
Parts list	11 - 36
Subassembly list	37 - 38

NOTE:

1. In the Illustrations the types of lubricant and adhesive to be used for the parts are indicated by the markings as below;

Lubricant:	▽ Grease (for low temp.)
	▼ O-ring grease
	◇ Oil (for low temp.)
	◆ Molybdenum disulphide grease
	◊ Gyro-oil
Adhesive:	⊗ Clear laquer
	⊞ Epoxy resin adhesive
	⊞ Synthetic rubber adhesive

2. Marks in the "Term of Sale" column of the parts list are;

○ Can be supplied individually
△ Not supplied individually but only as subassembly
○△ Supplied either as part or subassembly
× Not considered as repair part
⊞ Delivered as a product from the Sales Department (i.e., not supplied as repair part)

3. The parts marked * in the column "Remarks" in the Parts List are those which can commonly be used for 9FB (NIKONOS MODEL 1).

D1-----全部品

- (A) Both vertical and lateral sighting directions of the accessory shoe are to be correct within 10' and the inclination within 20'.
Use cementing agent #616.
- (B) Make sure that #634 and #622 are disengaged from each other when the shutter speed dial is set to R. Take care of the direction of #821.
- (C) After turning #604 a full or one and a half rotation in the direction of the arrow, set it with #610.
- (D) Make engagement so that the punch mark on the gear #794, the center of #783 and the punch mark on the gear #642 are exactly aligned.
- (E) Passing an L-shaped tool  through the holes (C) and (D), twist #622 about 3 rotations. Set #779 to the hole (A) through the hole (B) by means of set screw #618.
- (F) Wind up the lever (#813) until the alignment as described in (D) is realized. In this position raise #794 and keep it free from gearing with #783. While closing the winding lever, draw out subassembly #794 through the cut off part of #778.
- (G) The time-lag $22 \pm \frac{2}{5}$ m.s. of FP is a time to elapse between switching on of the FP circuit and appearance of the end of the front curtain at the start of running at 1/500 sec. shutter speed. The correct time-lag of FP contact is to be attained by smooth rotation of subassembly #729 - #739. No oil is used.

- H Adjusting #894, bring the locking pawl (#887) in engagement with the third tooth from the untoothed end of the ratchet wheel #705. Through the adjustment of #892, have the driving pawl (#883) engaged with the first tooth on the ratchet (#705) as illustrated here after the adjustments make sure of the correct zero return, etc.

- I The body earthing screws, after completely screwed into #648, are to be secured with #692.

Never use oil, cementing agent, etc. which is liable to reduce the contact efficiency.

- J Operation of #666 is to be smooth. If necessary, lubricate the axle (#668) with lubricant #7818 (10%).

The starting position of the front curtain is to be adjusted by bending (↪) the end of #666.

Note: Rotating slowly #729 at 1/500 sec. with your finger, make sure of the position of 0.5mm where the front curtain starts running.

- (K) For disassembly, remove #773, draw out #768 and #771, pull upward #767, and make the bottom end free from #761. For reassembling, reverse the disassembling procedure.
- (L) Time balance between the beginning, intermediate and ending of the shutter curtain running is adjusted by the vertical movement of #764A. The same adjusting method can be applied to the front and rear curtains.
- (M) Distances of the pawl ends of #720 and of #721 from the bottom plate are to be 3mm and 1.8mm, respectively.
- (N) Holding the camera upside-down with the winding lever closed, insert the shutter subassembly and then the bottom plate subassembly. Fitting the end of #767 to the hole in the bottom plate, engage the picture frame counter advancing stud (#893) with #880. After inserting the bottom plate completely, secure it with #810 and #810A.
- (O) Loosen the nut (#831) found inside #830 as far as one revolution from the tightly fastened position. While assembling #830 and #831, apply clear lacquer. If the operation of B-setting is found unstable, check the relative positions of #822, #823 and #825.

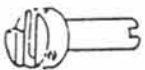

- P The flange back (from the lens thrust surface to the outer rail = $27.02_{mm}^{+0.02}$) is adjusted by changing the thickness of washer #832 A — D (0.04 — 0.1mm).
- Q Lowering of contact efficiency of the x-contact may be attributed to dust or oil found inside the contact. Therefore, before assembly, wash the contact part with alcohol or the like.
- R Even after #833 has been attached, #B6 can be inserted or taken out in the way illustrated here. Take care in this case not to injure the contact point.
- S If the synch. contact takes in water by careless handling, insufficient insulation and corrosion may result; it is necessary to disassemble and to wash the contact. Then, make reassembly after drying. In this case check the insulation resistance.

NIKONOS - II (35mm/2.5) USE OF O-RING

	Part No.	Position To Be Used	Pcs.	Relating Part	
4	543	Finder window gasket	1	G11 - 536	3
8	544	Finder eyepiece and synchro socket	2	G13 - 536 844 - 879	1
